

WHAT IS CLAIMED IS:

Sub
All

1. A system for optimization using multi-dimensional data, comprising:
a server operable to:
using a multi-dimensional data model, organize data stored at one or
more data storage locations, the multi-dimensional data model including a plurality of
data dimensions each including a hierarchy of members;
receive input from a user specifying a problem instance to be solved
using an optimization engine, the problem instance specified by the user in a multi-
dimensional format, the optimization engine being unable to solve the problem
instance in the multi-dimensional format; and
communicate the problem instance in the multi-dimensional format;
and
a transformation module operable to:
receive the problem instance in the multi-dimensional format;
transform the problem instance into a format appropriate for the
optimization engine; and
communicate the transformed problem instance to the optimization
engine to be solved.
2. The system of Claim 1, wherein the transformation module is further
operable to:
receive a solution associated with the problem instance from the optimization
engine;
transform the solution into the multi-dimensional format; and
communicate the transformed solution to the server.
3. The system of Claim 1, further comprising a business repository
operable to store the multi-dimensional data model, the server further operable to
communicate with the business repository to access data specified using the multi-
dimensional format.

4. The system of Claim 1, wherein transforming the problem instance comprises:

parsing the received problem instance to identify pre-defined multi-dimensional syntax; and

5 translating the multi-dimensional syntax to a syntax appropriate for the optimization engine.

10 5. The system of Claim 1, wherein transforming the problem instance comprises generating multiple problem constraints in a format appropriate for the optimization engine from a single problem constraint included in the received problem instance, the single problem constraint identifying a member in each data dimension to which the constraint is applicable.

15 6. The system of Claim 1, wherein transforming the problem instance comprises importing data applicable to the problem instance from one or more data storage locations, the imported data being included in the transformed problem instance in a format appropriate for the optimization engine.

20 7. The system of Claim 1, wherein the problem instance comprises:
a problem domain that includes all data in the multi-dimensional data model that is located hierarchically below one or more specified intersections in the multi-dimensional data model, each intersection identified by specifying a member in each data dimension;

25 an evaluation level specified by identifying a particular level in the hierarchy of each data dimension;

an objective function including a data measure or a combination of data measures to be optimized; and

one or more problem constraints.

30 8. The system of Claim 7, wherein one or more data measures included in the objective function have an associated data value in a data storage location for each of one or more intersections in the problem domain.

9. The system of Claim 7, wherein the objective function further comprises an aggregation domain for each data measure.

5 10. The system of Claim 1, wherein the server is further operable to replicate a single constraint in the multi-dimensional format into multiple constraints in the multi-dimensional format, the single constraint including one or more coverage sets identifying multiple members of one or more data dimensions to which the constraint applies.

10

020431.0862

11. A method for optimization using multi-dimensional data, comprising:
receiving a problem instance to be solved using an optimization engine, the
problem instance specified in a multi-dimensional format associated with a multi-
dimensional data model that includes a plurality of data dimensions each including a
5 hierarchy of members, the optimization engine being unable to solve the problem
instance in the multi-dimensional format;

using a transformation module, transforming the problem instance into a
format appropriate for the optimization engine; and
communicating the transformed problem instance to the optimization engine
10 to be solved.

12. The method of Claim 11, further comprising:
receiving a solution associated with the problem instance from the
optimization engine; and

15 using the transformation module, transforming the solution into the multi-
dimensional format.

13. The method of Claim 11, wherein transforming the problem instance
comprises:

20 parsing the received problem instance to identify pre-defined multi-
dimensional syntax; and

translating the multi-dimensional syntax to a syntax appropriate for the
optimization engine.

25 14. The method of Claim 11, wherein transforming the problem instance
comprises generating multiple problem constraints in a format appropriate for the
optimization engine from a single problem constraint included in the specified
problem instance, the single problem constraint identifying a member in each data
dimension to which the constraint is applicable.

15. The method of Claim 11, wherein transforming the problem instance comprises importing data applicable to the problem instance from one or more data storage locations, the imported data being included in the transformed problem instance in a format appropriate for the optimization engine.

5

16. The method of Claim 11, wherein the problem instance comprises:
a problem domain that includes all data in the multi-dimensional data model that is located hierarchically below one or more specified intersections in the multi-dimensional data model, each intersection identified by specifying a member in each data dimension;

10

an evaluation level specified by identifying a particular level in the hierarchy of each data dimension;

an objective function including a data measure or a combination of data measures to be optimized; and

15

one or more problem constraints.

17. The method of Claim 16, wherein one or more data measures included in the objective function have an associated data value in a data storage location for each of one or more intersections in the problem domain.

20

18. The method of Claim 16, wherein the objective function further comprises an aggregation domain for each data measure.

19. The method of Claim 11, further comprising automatically replicating a single constraint in the multi-dimensional format into multiple constraints in the multi-dimensional format, the single constraint including one or more coverage sets identifying multiple members of one or more data dimensions to which the constraint applies.

25

20. Software enabling optimization using multi-dimensional data, the software embodied in a computer-readable medium and when executed operable to:

receive a problem instance to be solved using an optimization engine, the problem instance specified in a multi-dimensional format associated with a multi-dimensional data model that includes a plurality of data dimensions each including a hierarchy of members, the optimization engine being unable to solve the problem instance in the multi-dimensional format;

transform the problem instance into a format appropriate for the optimization engine; and

communicate the transformed problem instance to the optimization engine to be solved.

21. The software of Claim 20, further operable to:

receive a solution associated with the problem instance from the optimization engine; and

transform the solution into the multi-dimensional format.

22. The software of Claim 20, wherein transforming the problem instance comprises:

parsing the received problem instance to identify pre-defined multi-dimensional syntax; and

translating the multi-dimensional syntax to a syntax appropriate for the optimization engine.

23. The software of Claim 20, wherein transforming the problem instance comprises generating multiple problem constraints in a format appropriate for the optimization engine from a single problem constraint included in the specified problem instance, the single problem constraint identifying a member in each data dimension to which the constraint is applicable.

24. The software of Claim 20, wherein transforming the problem instance comprises importing data applicable to the problem instance from one or more data storage locations, the imported data being included in the transformed problem instance in a format appropriate for the optimization engine.

25. The software of Claim 20, wherein the problem instance comprises:
a problem domain that includes all data in the multi-dimensional data model that is located hierarchically below one or more specified intersections in the multi-dimensional data model, each intersection identified by specifying a member in each data dimension;
an evaluation level specified by identifying a particular level in the hierarchy of each data dimension;
an objective function including a data measure or a combination of data measures to be optimized; and
one or more problem constraints.

26. The software of Claim 25, wherein one or more data measures included in the objective function have an associated data value in a data storage location for each of one or more intersections in the problem domain.

27. The software of Claim 25, wherein the objective function further comprises an aggregation domain for each data measure.

28. The software of Claim 20, further operable to replicate a single constraint in the multi-dimensional format into multiple constraints in the multi-dimensional format, the single constraint including one or more coverage sets identifying multiple members of one or more data dimensions to which the constraint applies.

29. A system for optimization using multi-dimensional data, comprising:

means for receiving a problem instance to be solved using an optimization engine, the problem instance specified in a multi-dimensional format associated with a multi-dimensional data model that includes a plurality of data dimensions each including a hierarchy of members, the optimization engine being unable to solve the problem instance in the multi-dimensional format;

means for transforming the problem instance into a format appropriate for the optimization engine; and

means for communicating the transformed problem instance to the optimization engine to be solved.

30. A system for optimization using multi-dimensional data, comprising:
a server operable to:

using a multi-dimensional data model, organize data stored at one or
more data storage locations, the multi-dimensional data model including a plurality of
data dimensions each including a hierarchy of members;

receive input from a user specifying a problem instance to be solved
using an optimization engine, the problem instance specified by the user in a multi-
dimensional format, the optimization engine being unable to solve the problem
instance in the multi-dimensional format, the problem instance including:

a problem domain that includes all data in the multi-
dimensional data model that is located hierarchically below one or more specified
intersections in the multi-dimensional data model, each intersection identified by
specifying a member in each data dimension;

an evaluation level specified by identifying a particular level in
the hierarchy of each data dimension;

an objective function including a data measure or a
combination of data measures to be optimized; and

one or more problem constraints; and

communicate the problem instance in the multi-dimensional format;

and

a transformation module operable to:

receive the problem instance in the multi-dimensional format;

transform the problem instance into a format appropriate for the
optimization engine, the transformation including parsing the received problem
instance to identify pre-defined multi-dimensional syntax and translating the multi-
dimensional syntax to a syntax appropriate for the optimization engine;

communicate the transformed problem instance to the optimization
engine to be solved;

receive a solution associated with the problem instance from the
optimization engine;

transform the solution into the multi-dimensional format; and

communicate the transformed solution to the server.

31. A method for optimization using multi-dimensional data, comprising:
receiving a problem instance to be solved using an optimization engine, the
problem instance specified in a multi-dimensional format associated with a multi-
dimensional data model that includes a plurality of data dimensions each including a
5 hierarchy of members, the optimization engine being unable to solve the problem
instance in the multi-dimensional format, the problem instance including:

a problem domain that includes all data in the multi-dimensional data
model that is located hierarchically below one or more specified intersections in the
multi-dimensional data model, each intersection identified by specifying a member in
10 each data dimension;

an evaluation level specified by identifying a particular level in the
hierarchy of each data dimension;

an objective function including a data measure or a combination of
data measures to be optimized; and

15 one or more problem constraints; and

communicate the problem instance in the multi-dimensional format;
and

using a transformation module, transforming the problem instance into a
format appropriate for the optimization engine, the transformation including parsing
20 the received problem instance to identify pre-defined multi-dimensional syntax and
translating the multi-dimensional syntax to a syntax appropriate for the optimization
engine;

communicating the transformed problem instance to the optimization engine
to be solved;

25 receiving a solution associated with the problem instance from the
optimization engine;

using the transformation module, transforming the solution into the multi-
dimensional format; and

communicating the transformed solution to the server.

32. Software enabling optimization using multi-dimensional data, the software embodied in a computer-readable medium and when executed operable to:

receive a problem instance to be solved using an optimization engine, the problem instance specified in a multi-dimensional format associated with a multi-dimensional data model that includes a plurality of data dimensions each including a hierarchy of members, the optimization engine being unable to solve the problem instance in the multi-dimensional format, the problem instance including:

a problem domain that includes all data in the multi-dimensional data model that is located hierarchically below one or more specified intersections in the multi-dimensional data model, each intersection identified by specifying a member in each data dimension;

an evaluation level specified by identifying a particular level in the hierarchy of each data dimension;

an objective function including a data measure or a combination of data measures to be optimized; and

one or more problem constraints; and

communicate the problem instance in the multi-dimensional format;

and

transform the problem instance into a format appropriate for the optimization engine, the transformation including parsing the received problem instance to identify pre-defined multi-dimensional syntax and translating the multi-dimensional syntax to a syntax appropriate for the optimization engine;

communicate the transformed problem instance to the optimization engine to be solved;

receive a solution associated with the problem instance from the optimization engine;

transform the solution into the multi-dimensional format; and

communicate the transformed solution to the server.
